

This explanation describes the software's general behaviour across reference patients and helps answer the following question:

Which patient measurements tend to matter most to the diabetes risk score?

Main takeaway: HbA1c and fasting blood glucose have the largest average influence on the diabetes risk score across the reference patients, while BMI and age have smaller

How to read it: Dots to the left tend to lower the score; dots to the right tend to raise it. Colour shows relatively lower or higher measurement values.

Assessment note: the visual below is another representation of the same explanation content. Judge the information conveyed, not the visual design.

TENDS TO
LOWER DIABETES
RISK SCORE

TENDS TO RAISE
DIABETES RISK
SCORE

HbA1c

Largest average influence

Average size of influence: 8.4
score points

Fasting blood glucose

Second-largest average influence

Average size of influence: 6.7
score points
