

This explanation describes the software's general behaviour across reference patients and helps answer the following question:

Which measurement cutoffs are linked with typically higher, middle-range or lower diabetes risk scores?

Main takeaway: the highest typical diabetes risk scores occur when HbA1c is at least value until you reach a final box.

Assessment note: the visual below is another representation of the same explanation content. Judge the information conveyed, not the visual design.

Start with HbA1c: is it at least 6.0%?

HbA1c $\geq$ 6.0%

HbA1c < 6.0%

Then check fasting blood glucose: is it at least 110 mg/dL?

Then check BMI: is it at least 30 kg/m²?
